

## Statistical coding

### TEST

Let us consider a source  $S$  which sends 8 symbols  $s_i$  with the following probabilities  $\Pr(s_i)$ :

S	$s_1$	$s_2$	$s_3$	$s_4$	$s_5$	$s_6$	$s_7$	$s_8$
$\Pr(s_i)$	0.1	0.19	0.21	0.3	0.05	0.05	0.07	0.03

- 1- Calculate the entropy  $H(S)$  of the source  $S$ .
- 2- Build the natural binary code  $C_1$  (fixed length code) corresponding to this source. Deduce the efficiency  $\eta_1$  and the redundancy  $\rho_1$  of this code.
- 3- Build the Huffman code  $C_2$  corresponding to this source (binary alphabet). Calculate the average length of the code. Deduce the efficiency  $\eta_2$  and the redundancy  $\rho_2$  of this code. Compare the results with the code  $C_1$ .
- 4- Let us consider that the source  $S$  sends the 8 symbols  $s_i$  with the new probabilities  $\Pr(s_i)$  :

S	$s_1$	$s_2$	$s_3$	$s_4$	$s_5$	$s_6$	$s_7$	$s_8$
$\Pr(s_i)$	0.12	0.19	0.19	0.25	0.07	0.06	0.04	0.08

Each symbol  $s_i$  has the same code-word than it had before with the Huffman code  $C_2$ . Calculate the average length of this code, deduce the efficiency  $\eta_3$  and the redundancy  $\rho_3$  of the code. Compare with the results of the code  $C_2$ . Conclude.

- 5- What kind of code would allow you to compensate this loss? Why?
